#### Input/output

Victor Eijkhout, Susan Lindsey

Fall 2023 last formatted: November 5, 2023

# 1. I/O, what's it about?

Input: getting data from keyboard or file into your program.

Output: getting data from your program to screen or file.

#### The fmtlib library

## 2. Simple example

The basic usage is:

```
int i=2;
format("string {} brace expressions",i);
```

Format string, and arguments.

## 3. Displaying the format result

Use cout or (C++23) print:

```
Code:

1 // io/fmtbasic.cpp
2   cout << format("{}\n",2);
3   string hello_string = format
4   ("{} {}!","Hello","world");
5   cout << hello_string << '\n';
6   print
7   ("{0}, {0}
    {1}!\n","Hello","world");</pre>
```

```
Output:

2
Hello world!
Hello, Hello world!
```

## 4. Right align

Right-align with > character and width:

```
Code:
1 // io/fmtlib.cpp
2    for (int i=10; i<2000000000;
        i*=10)
3    fmt::print("{:>6}\n",i);
```

## 5. Padding character

Other than space for padding:

```
Code:
1 // io/fmtlib.cpp
2    for (int i=10; i<2000000000;
        i*=10)
3    fmt::print("{0:.>6}\n",i);
```

```
Output:
....10
...100
..1000
.10000
100000
1000000
10000000
100000000
1000000000
1410065408
1215752192
```

#### 6. Number bases

```
Code:

1 // io/fmtlib.cpp
2    fmt::print
3    ("{0} = {0:b} bin\n",17);
4    fmt::print
5    (" = {0:o} oct\n",17);
6    fmt::print
7    (" = {0:x} hex\n",17);
```

```
Output:

17 = 10001 bin

= 21 oct

= 11 hex
```

#### 7. Hex numbers

Display the numbers 0...255 in a square

```
for (int i=0; i<16; i++)
for (int j=0; j<16; j++)
// output 16*i+j on base 16</pre>
```

```
0 1 2 3 4 5 6 7 8 9 a b c d e f
10 11 12 13 14 15 16 17 18 19 1a 1b 1c 1d 1e 1f
20 21 22 23 24 25 26 27 28 29 2a 2b 2c 2d 2e 2f
30 31 32 33 34 35 36 37 38 39 3a 3b 3c 3d 3e 3f
40 41 42 43 44 45 46 47 48 49 4a 4b 4c 4d 4e 4f
50 51 52 53 54 55 56 57 58 59 5a 5b 5c 5d 5e 5f
60 61 62 63 64 65 66 67 68 69 6a 6b 6c 6d 6e 6f
70 71 72 73 74 75 76 77 78 79 7a 7b 7c 7d 7e 7f
80 81 82 83 84 85 86 87 88 89 8a 8b 8c 8d 8e 8f
90 91 92 93 94 95 96 97 98 99 9a 9b 9c 9d 9e 9f
a0 a1 a2 a3 a4 a5 a6 a7 a8 a9 aa ab ac ad ae af
b0 b1 b2 b3 b4 b5 b6 b7 b8 b9 ba bb bc bd be bf
c0 c1 c2 c3 c4 c5 c6 c7 c8 c9 ca cb cc cd ce cf
```

#### Exercise 1

Make the first line in the above output align better with the other lines:

```
00 01 02 03 04 05 06 07 08 09 0a 0b 0c 0d 0e 0f 10 11 12 13 14 15 16 17 18 19 1a 1b 1c 1d 1e 1f 20 21 22 23 24 25 26 27 28 29 2a 2b 2c 2d 2e 2f etc
```

#### 8. Float and fixed

Floating point or normalized exponential with e specifier fixed: use decimal point if it fits, m.n specification

```
Code:

1 // io/fmtfloat.cpp
2  x = 1.234567;
3  for (int i=0; i<6; ++i) {
4   fmt::print
5   ("{0:.3e}/{0:7.4}\n",x);
6  x *= 10;
7 }</pre>
```

```
Output:

1.235e+00/ 1.235

1.235e+01/ 12.35

1.235e+02/ 123.5

1.235e+03/ 1235

1.235e+04/1.235e+04

1.235e+05/1.235e+05
```

## 9. Treatment of leading sign

Positive sign always, nothing, blank:

```
Output:
|+3.14e+00|-3.14e+00|
|3.14e+00|-3.14e+00|
| 3.14e+00|-3.14e+00|
```

## 10. fmtlib: installing

- Download: https://github.com/fmtlib/fmt
- Cmake installation
- add lib/pkgconfig to PKG\_CONFIG\_PATH

## 11. fmtlib: compilation

#### Compilation on the commandline:

```
g++ -o myprog myprog.cpp \
    $( pkg-config --cflags fmt ) \
    $( pkg-config --libs fmt )
```

## 12. fmtlib: compilation'

Using CMake:

```
find_package( PkgConfig REQUIRED )
pkg check modules( FMTLIB REQUIRED fmt )
target include directories(
     ${PROGRAM_NAME} PUBLIC ${FMTLIB_INCLUDE_DIRS} )
target link directories(
     ${PROGRAM_NAME} PUBLIC ${FMTLIB_LIBRARY_DIRS})
target_link_libraries(
     ${PROGRAM_NAME} PUBLIC ${FMTLIB_LIBRARIES})
set_target_properties(
     ${PROGRAM NAME} PROPERTIES
     BUILD_RPATH "${FMTLIB_LIBRARY_DIRS}"
     INSTALL RPATH "${FMTLIB LIBRARY DIRS}"
```

# 13. fmtlib: use through pkg-config

When you install fmtlib, note the location of the .pc file, then

export

 ${\tt PKG\_CONFIG\_PATH=/the/location/from/fmtlib:\$\{PKG\_CONFIG\_PATH\}}$ 

in your .bashrc (Mac users: .zshrc)

#### Formatted stream output

## 14. Formatted output

From iostream: cout uses default formatting.

Possible manipulation in iomanip header: pad a number, use limited precision, format as hex, etc.

## 15. Default unformatted output

```
Code:
1 // io/io.cpp
2  for (int i=1; i<200000000; i*=10)
3    cout << "Number: " << i << '\n';</pre>
```

```
Output:

Number: 1

Number: 10

Number: 100

Number: 1000

Number: 10000

Number: 100000

Number: 1000000

Number: 10000000

Number: 10000000

Number: 10000000
```

## 16. Reserve space

You can specify the number of positions, and the output is right aligned in that space by default:

```
Code:
1 // io/width.cpp
2 #include <iomanip>
3 using std::setw;
  /* ... */
5 cout << "Width is 6:" << '\n';</pre>
6 for (int i=1; i<200000000; i*=10)
    cout << "Number: "
           << setw(6) << i << '\n':
   cout << '\n':
10
   // `setw' applies only once:
12
  cout << "Width is 6:" << '\n':
  cout << ">"
13
         << setw(6) << 1 << 2 << 3 <<
14
       '\n':
    cout << '\n';
15
```

```
Output:
Width is 6:
Number:
Number: 10
Number: 100
Number: 1000
Number: 10000
Number: 100000
Number: 1000000
Number: 10000000
Number: 100000000
Width is 6:
     123
```

### 17. Padding character

Normally, padding is done with spaces, but you can specify other characters:

```
      Output:

      Number:
      ....1

      Number:
      ...10

      Number:
      ..100

      Number:
      .1000

      Number:
      100000

      Number:
      1000000

      Number:
      10000000

      Number:
      100000000

      Number:
      100000000
```

Note: single quotes denote characters, double quotes denote strings.

## 18. Left alignment

Instead of right alignment you can do left:

```
      Output:

      Number: 1.....

      Number: 10....

      Number: 100...

      Number: 1000...

      Number: 10000.

      Number: 100000

      Number: 1000000

      Number: 10000000

      Number: 10000000

      Number: 100000000
```

#### 19. Number base

Finally, you can print in different number bases than 10:

```
Code:

1 // io/format16.cpp
2 #include <iomanip>
3 using std::setbase;
4 using std::setfill;
5 /* ... */
6 cout << setbase(16)
7 <> setfill('');
8 for (int i=0; i<16; ++i) {
9 for (int j=0; j<16; ++j)
10 cout << i*16+j << " ";
11 cout << '\n';
12 }
```

```
Output:

0 1 2 3 4 5 6 7 8 9 a b c d e f
10 11 12 13 14 15 16 17 18 19 1a 1b 1c 1d 1e 1f
20 21 22 23 24 25 26 27 28 29 2a 2b 2c 2d 2e 2f
30 31 32 33 34 35 36 37 38 39 3a 3b 3c 3d 3e 3f
40 41 42 43 44 45 46 47 48 49 4a 4b 4c 4d 4e 4f
50 51 52 53 54 55 56 57 58 59 5a 5b 5c 5d 5e 5f
60 61 62 63 64 65 66 67 68 69 6a 6b 6c 6d 6e 6f
70 71 72 73 74 75 76 77 78 79 7a 7b 7c 7d 7e 7f
80 81 82 83 84 85 86 87 88 89 8a 8b 8c 8d 8e 8f
90 91 92 93 94 95 96 97 98 99 9a 9b 9c 9d 9e 9f
```

#### Exercise 2

Use integer output to print real numbers aligned on the decimal:

```
Code:

1 // io/quasifix.cpp
2 string quasifix(double);
3 int main() {
4 for ( auto x : { 1.5, 12.32, 123.456, 1234.5678 } )
5 cout << quasifix(x) << '\n';
```

Use four spaces for both the integer and fractional part; test only with numbers that fit this format.

#### 20. Hexadecimal

Hex output is useful for addresses (chapter ??):

```
Output:

address of i, decimal:
    140732703427524

address of i, hex :
    0x7ffee2cbcbc4
```

#### Back to decimal:

```
cout << hex << i << dec << j;</pre>
```

Floating point formatting

## 21. Floating point precision

Use setprecision to set the number of digits before and after decimal point:

```
Code:
1 // io/formatfloat.cpp
2 #include <iomanip>
3 using std::left;
4 using std::setfill;
5 using std::setw;
6 using std::setprecision;
   /* ... */
x = 1.234567;
9 for (int i=0; i<10; ++i) {</pre>
      cout << setprecision(4) << x <<</pre>
       '\n':
      x *= 10:
11
12
    }
```

```
Output:

1.235
12.35
123.5
1235
1.235e+04
1.235e+05
1.235e+06
1.235e+07
1.235e+08
1.235e+09
```

This mode is a mix of fixed and floating point. See the scientific option below for consistent use of floating point format.

### 22. Fixed point precision

Fixed precision applies to fractional part:

```
Output:

1.2346

12.3457

123.4567

1234.5670

12345.6700

123456.7000

1234567.0000

12345670.0000

123456700.0000

1234567000.0000
```

(Notice the rounding)

## 23. Aligned fixed point output

#### Combine width and precision:

```
0utput:

1.2346

12.3457

123.4567

1234.5670

12345.6700

123456.7000

1234567.0000

12345670.0000

123456700.0000

123456700.0000
```

#### 24. Scientific notation

#### Combining width and precision:

```
Output:

1.2346e+00

1.2346e+01

1.2346e+02

1.2346e+03

1.2346e+04

1.2346e+05

1.2346e+06

1.2346e+07

1.2346e+08

1.2346e+09
```

#### File output

## 25. Text output to file

Use:

```
Code:
1 // io/fio.cpp
2 #include <fstream>
3 using std::ofstream;
4     /* ... */
5     ofstream file_out;
6     file_out.open
7     ("fio_example.out");
8     /* ... */
9     file_out << number << '\n';
10     file_out.close();</pre>
```

```
Output:

echo 24 | ./fio ; \
cat
fio_example.out
A number please:
Written.
24
```

Compare: cout is a stream that has already been opened to your terminal 'file'.

# **26.** Binary I/O

Binary output: write your data byte-by-byte from memory to file. (Why is that better than a printable representation?)

```
Code:

1 // io/fiobin.cpp
2    cout << "Writing: " << x << '\n';
3    ofstream file_out;
4    file_out.open
5    ("fio_binary.out",ios::binary);
6    file_out.write
7    (reinterpret_cast<char*>(&x),
8         sizeof(double));
9    file_out.close();
```

```
Output:
Writing: 0.841471
```

write takes an address and the number of bytes.

# 27. Binary I/O'

Input is mirror of the output:

```
Code:

1 // io/fiobin.cpp
2   ifstream file_in;
3   file_in.open
4   ("fio_binary.out",ios::binary);
5   file_in.read
6   (reinterpret_cast<char*>(&x),
7    sizeof(double));
8   file_in.close();
9   cout << "Read : " << x << '\n';</pre>
```

```
Output:
Read : 0.841471
```

Cout on classes (for future reference)

#### 28. Redefine less-less

If you want to output a class that you wrote yourself, you have to define how the << operator deals with your class.

```
// stl/ostream.cpp
class container {
    /* ... */
  int value() const {
   /* ... */
  }:
    /* ... */
ostream & operator << (ostream & os, const container & i) {
  os << "Container: " << i.value();
  return os;
};
    /* ... */
  container eye(5);
  cout << eye << '\n';
```
